

# Spectrum

Let  $\mathbf{k}$  be a spherically complete non-archimedean field which is algebraically closed and  $A = \mathbf{k}[T]$ . We want to consider the “analytic structure” on  $\mathrm{mSpec} A$ . However, unlike the complex case, the set  $\mathrm{mSpec} A$  is totally disconnected with respect to the topology induced by the absolute value on  $\mathbf{k}$  (??). To overcome this difficulty, Berkovich uses multiplicative semi-norms to “fill in the gaps” between the points in  $\mathrm{mSpec} A$ , leading to the notion of the spectrum of a Banach ring.

We first consider the local model. Hence we should consider the Tate algebra  $\mathbf{k}\{T\}$  instead of the polynomial ring  $\mathbf{k}[T]$ . Yang: The maximal ideal of  $\mathbf{k}\{T\}$  corresponding to the point in the disk  $\{a \in \mathbf{k} : a \leq 1\}$ . Yang: Closed or open disk?

## 1 Definition

**Definition 1.** Let  $R$  be a Banach ring. The *spectrum*  $\mathcal{M}(R)$  of  $R$  is defined as the set of all multiplicative semi-norms on  $R$  that are bounded with respect to the given norm on  $R$ . For every point  $x \in \mathcal{M}(R)$ , we denote the corresponding multiplicative semi-norm by  $|\cdot|_x$ . We equip  $\mathcal{M}(R)$  with the weakest topology such that for each  $f \in R$ , the evaluation map  $\mathcal{M}(R) \rightarrow \mathbb{R}_{\geq 0}$ , defined by  $x \mapsto |f|_x =: f(x)$ , is continuous.

**Example 2.** Let  $(\mathbf{k}, |\cdot|)$  be a complete valuation field. The spectrum  $\mathcal{M}(\mathbf{k})$  consists of a single point corresponding to the given absolute value  $|\cdot|$  on  $\mathbf{k}$ . Yang: To be checked.

**Example 3.** Consider the Banach ring  $(\mathbb{Z}, \|\cdot\|)$  with  $\|\cdot\| = |\cdot|_\infty$  is the usual absolute value norm on  $\mathbb{Z}$ . Let  $|\cdot|_p$  denote the  $p$ -adic norm for each prime number  $p$ , i.e.,  $|n|_p = p^{-v_p(n)}$  for each  $n \in \mathbb{Z}$ , where  $v_p(n)$  is the  $p$ -adic valuation of  $n$ . The spectrum

$$\mathcal{M}(\mathbb{Z}) = \{|\cdot|_\infty^\varepsilon : \varepsilon \in (0, 1]\} \cup \{|\cdot|_p^\alpha : p \text{ is prime}, \alpha \in (0, \infty]\} \cup \{|\cdot|_0\},$$

where  $|a|_p^\infty := \lim_{\alpha \rightarrow \infty} |a|_p^\alpha$  for each  $a \in \mathbb{Z}$  and  $|\cdot|_0$  is the trivial norm on  $\mathbb{Z}$ . Yang: To be checked.

**Definition 4.** Let  $\varphi : R \rightarrow S$  be a bounded ring homomorphism of Banach rings. The *pullback* map  $\mathcal{M}(\varphi) : \mathcal{M}(S) \rightarrow \mathcal{M}(R)$  is defined by  $\mathcal{M}(\varphi)(x) = x \circ \varphi : f \mapsto |\varphi(f)|_x$  for each  $x \in \mathcal{M}(S)$ .

**Proposition 5.** Let  $\varphi : R \rightarrow S$  be a bounded ring homomorphism of Banach rings. The pullback map  $\mathcal{M}(\varphi) : \mathcal{M}(S) \rightarrow \mathcal{M}(R)$  is continuous.

*Proof.* Yang: To be completed. □

**Definition 6.** Let  $R$  be a Banach ring. For each  $x \in \mathcal{M}(R)$ , the *completed residue field* at the point  $x$  is defined as the completion of the residue field  $\kappa(x) = \mathrm{Frac}(R/\varphi_x)$  with respect to the multiplicative norm induced by the semi-norm  $|\cdot|_x$ , denoted by  $\mathcal{H}(x)$ .

**Definition 7.** Let  $R$  be a Banach ring. The *Gel'fand transform* of  $R$  is the bounded ring homomorphism

$$\Gamma : R \rightarrow \prod_{x \in \mathcal{M}(R)} \mathcal{H}(x), \quad f \mapsto (f(x))_{x \in \mathcal{M}(R)},$$

where the norm on the product  $\prod_{x \in \mathcal{M}(R)} \mathcal{H}(x)$  is given by the supremum norm.

**Proposition 8.** The Gel'fand transform  $\Gamma : R \rightarrow \prod_{x \in \mathcal{M}(R)} \mathcal{H}(x)$  of a Banach ring  $R$  factors through the uniformization  $R^u$  of  $R$ , and the induced map  $R^u \rightarrow \prod_{x \in \mathcal{M}(R)} \mathcal{H}(x)$  is an isometric embedding.

Yang: To be checked.

**Theorem 9.** Let  $R$  be a Banach ring. The spectrum  $\mathcal{M}(R)$  is nonempty.

| *Proof.* Yang: To be continued. □

**Lemma 10.** Let  $\{K_i\}_{i \in I}$  be a family of completed fields. Consider the Banach ring  $R = \prod_{i \in I} K_i$  equipped with the product norm. The spectrum  $\mathcal{M}(R)$  is homeomorphic to the Stone-Čech compactification of the discrete space  $I$ .

**Remark 11.** The Stone-Čech compactification of a discrete space is the largest compact Hausdorff space in which the original space can be densely embedded. Yang: To be checked.

**Theorem 12.** Let  $R$  be a Banach ring. The spectrum  $\mathcal{M}(R)$  is a compact Hausdorff space.

| *Proof.* Yang: To be added. □

**Proposition 13.** Let  $K/k$  be a Galois extension of complete fields, and let  $R$  be a Banach  $k$ -algebra. The Galois group  $\text{Gal}(K/k)$  acts on the spectrum  $\mathcal{M}(R \hat{\otimes}_k K)$  via

$$g \cdot x : f \mapsto |(1 \otimes g^{-1})(f)|_x$$

for each  $g \in \text{Gal}(K/k)$ ,  $x \in \mathcal{M}(R \hat{\otimes}_k K)$  and  $f \in R \hat{\otimes}_k K$ . Moreover, the natural map  $\mathcal{M}(R \hat{\otimes}_k K) \rightarrow \mathcal{M}(R)$  induces a homeomorphism

$$\mathcal{M}(R \hat{\otimes}_k K) / \text{Gal}(K/k) \xrightarrow{\sim} \mathcal{M}(R).$$

Yang: To be checked.

## 2 Reduction map and kernel map

**Proposition 14.** Let  $R$  be a Banach ring. For each  $x \in \mathcal{M}(R)$ , let  $\wp_x$  be the kernel of the multiplicative semi-norm  $|\cdot|_x$ . Then  $\wp_x$  is a closed prime ideal of  $R$ , and  $x \mapsto \wp_x$  defines a continuous map from  $\mathcal{M}(R)$  to  $\text{Spec}(R)$  equipped with the Zariski topology.

| *Proof.* Yang: To be completed □

Suppose that  $R$  is a non-archimedean Banach ring with valuation subring  $R^\circ$  and maximal ideal  $R^{\circ\circ}$ . There is a natural reduction map from the spectrum  $\mathcal{M}(R)$  to the spectrum  $\text{Spec}(\tilde{R} = R^\circ / R^{\circ\circ})$  of the residue ring  $\tilde{R}$ .

Yang: To be continued.

### 3 Spectrum of Tate algebras

**Spectrum of Tate algebra in one variable** Let  $\mathbf{k}$  be a complete non-archimedean field, and let  $A = \mathbf{k}\{T/r\}$ . We list some types of points in the spectrum  $\mathcal{M}(A)$ .

For each  $a \in \mathbf{k}$  with  $|a| \leq r$ , we have the *type I* point  $x_a$  corresponding to the evaluation at  $a$ , i.e.,  $|f|_{x_a} := |f(a)|$  for each  $f \in A$ . For each closed disk  $E = E(a, s) := \{b \in \mathbf{k} : |b - a| \leq s\}$  with center  $a \in \mathbf{k}$  and radius  $s \leq r$ , we have the point  $x_{a,s}$  corresponding to the multiplicative semi-norm defined by

$$|f|_{x_E} := \sup_{b \in E(a,s)} |f(b)|$$

for each  $f \in A$ . If  $s \in |\mathbf{k}^\times|$ , then the point  $x_E$  is called a *type II* point; otherwise, it is called a *type III* point.

Let  $\{E^{(s)}\}_s$  be a family of closed disks in  $\mathbf{k}$  such that  $E^{(s)}$  is of radius  $s$ ,  $E^{(s_1)} \subsetneq E^{(s_2)}$  for any  $s_1 < s_2$  and  $\bigcap_s E^{(s)} = \emptyset$ . Then we have the point  $x_{\{E^{(s)}\}}$  corresponding to the multiplicative semi-norm defined by

$$|f|_{x_{\{E^{(s)}\}}} := \inf_s |f|_{x_{E^{(s)}}}$$

for each  $f \in A$ . Such a point is called a *type IV* point.

Yang: To be completed.

**Proposition 15.** The points in the spectrum  $\mathcal{M}(\mathbf{k}\{r^{-1}T\})$  can be classified into four types as described above. Yang: To be checked

| Proof. Yang: To be completed. □

**Proposition 16.** The completed residue fields of the four types of points in the spectrum  $\mathcal{M}(\mathbf{k}\{r^{-1}T\})$  are described as follows:

- type I point  $x_a$ :  $\mathcal{H}(x_a)$  is isomorphic to  $\mathbf{k}$ ;
- type II point  $x_{a,s}$ :  $\mathcal{H}(x_{a,s}) \cong \mathcal{K}_{\mathbf{k}}((t))$ ;
- type III point  $x_{a,s}$ :  $\mathcal{K}_{\mathcal{H}(x_{a,s})} \cong \mathcal{K}_{\mathbf{k}}$  and the value group  $|\mathcal{H}(x_{a,s})^\times|$  is generated by  $|\mathbf{k}^\times|$  and  $s$ ;
- type IV point  $x_{\{E^{(s)}\}}$ :  $\mathcal{H}(x_{\{E^{(s)}\}})$  is an immediate extension of  $\mathbf{k}$ .

Yang: To be checked.

**Example 17.** The completed residue field  $\mathcal{H}(x_a)$  for a type I point  $x_a$  with  $a \in \mathbf{k}$  and  $|a| \leq r$  is isomorphic to  $\mathbf{k}$ . Yang: To be complete.

**Spectrum of Tate algebra in several variables** Let  $\mathbf{k}$  be a complete non-archimedean field, and let  $A = \mathbf{k}\{r_1^{-1}T_1, \dots, r_n^{-1}T_n\}$ . We can consider the spectrum  $\mathcal{M}(A)$  similarly.

## Appendix
